SIEMENS

District heating controller

RVD250

for 1 heating circuit and d.h.w., communicating

Multifunctional heating controller for district heat transfer stations and plants with LPB and M-bus communication. Suited for the control of 1 heating circuit with d.h.w. heating in instantaneous systems or with d.h.w. storage tank. 28 programmed plant types. Operating voltage AC 230 V.

Use

- Types of plants:
 - Autonomous heating group with own d.h.w. heating system, with connection to a district heat transfer station
 - Interconnected plants consisting of several heating groups each with 1 heating circuit and d.h.w. heating system; in a district heat transfer station
- Types of buildings: Residential and nonresidential buildings with own district heat connection and d.h.w. heating system
- Types of heating systems: All types of standard heating systems, such as radiator, convector, underfloor and ceiling heating systems, including radiant panels
- Types of d.h.w. heating systems:
 - D.h.w. heating with storage tank or in instantaneous systems
 - Common or separate heat exchangers for heating circuit and d.h.w. heating
 - D.h.w. heating with electric immersion heater and solar collector

Ordering

When ordering, please give product no. RVD250 and language code -A or -C for the Operating and Installation Instructions in the required languages.

Sensors, room units, actuators and valves must be ordered as separate items.

Examples: RVD250-A for German, French, etc. RVD250-C for Polish, Czech, etc.

Note

Equipment combinations

Suitable sensors and	Flow, return and d.h.w. temperature:
room units	All sensors with sensing element LG-Ni1000, e.g.:
	 Strap-on sensor QAD22
	 Immersion sensors QAE212 and QAP21.3
	 Collector sensor QAP21.2 (solar)
	Room temperature:
	 Room units (PPS) QAW50 and QAW70
	 Room sensor (PPS) QAA10
	Outside temperature:
	 Outside sensor QAC22 (sensing element LG-Ni1000)
	 Outside sensor QAC32 (sensing element NTC 575)
	 Pressure: Sensors delivering DC 010 V signals, e.g. Pressure sensor QBE2002
Note	The RVD250 controller automatically identifies the type of sensor used.
Suitable actuators	All types of Siemens electromotoric and electrohydraulic actuators for 3-position control
	operating on AC 24230 V can be used.
	With d.h.w. applications, consideration must be given to actuator running times and sensor time constants. For detailed information, refer to the Basic Documentation.
	For detailed information about actuators and valves, refer to the respective Data
	Sheets.

Technical design

Functioning

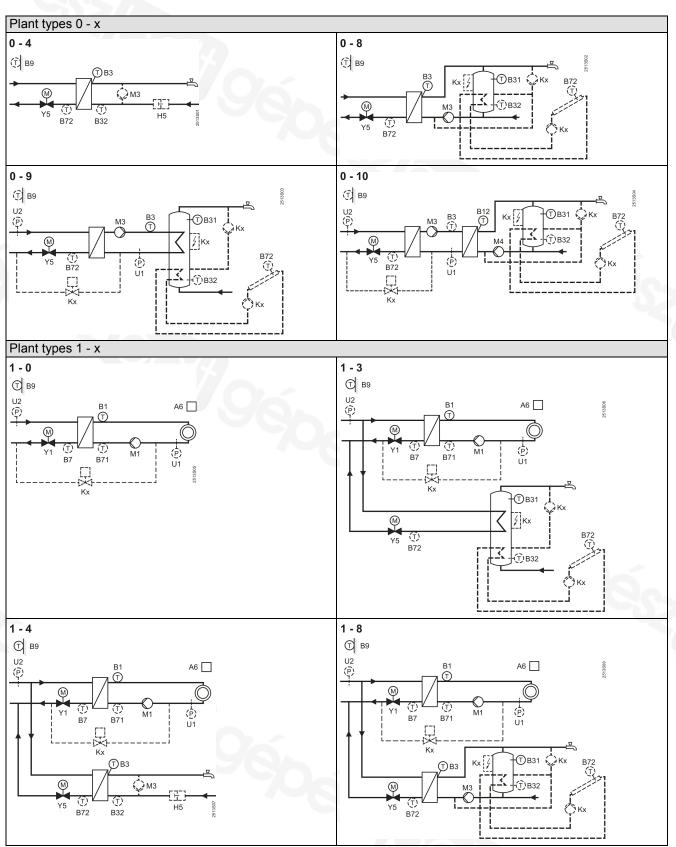

The RVD250 controller allows the configuration of 28 different plant types as combinations of heating circuit and d.h.w. heating system. When commissioning a plant, the relevant plant type must be selected and entered. All

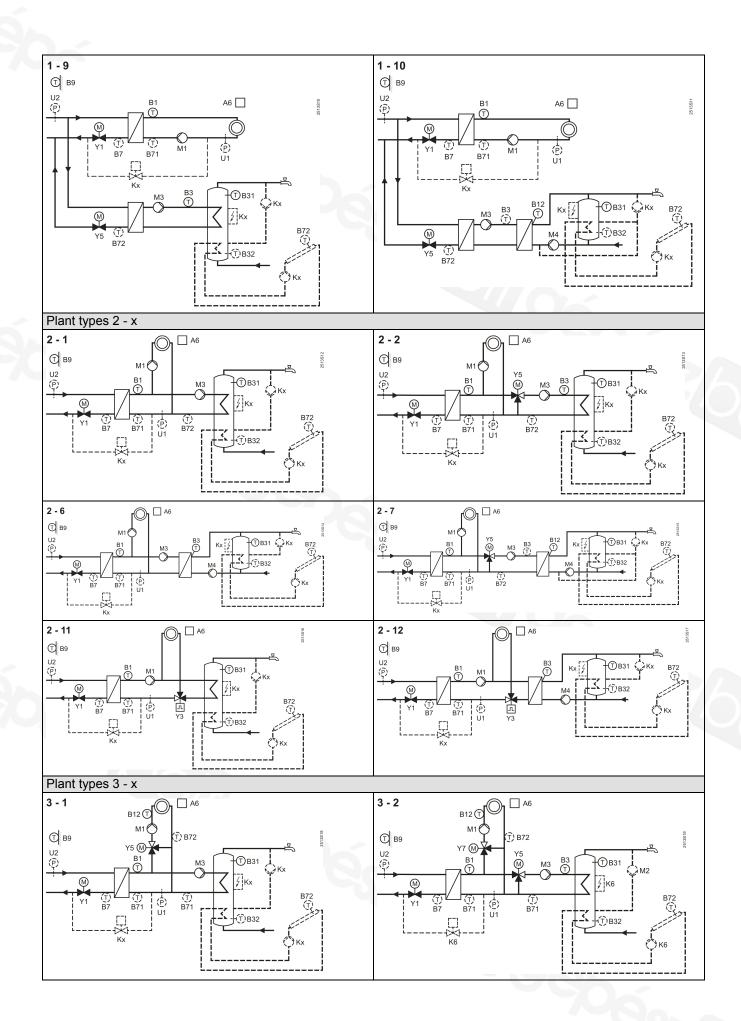

required functions, settings and displays are then automatically assigned, and parameters that are not required will be hidden.

Note

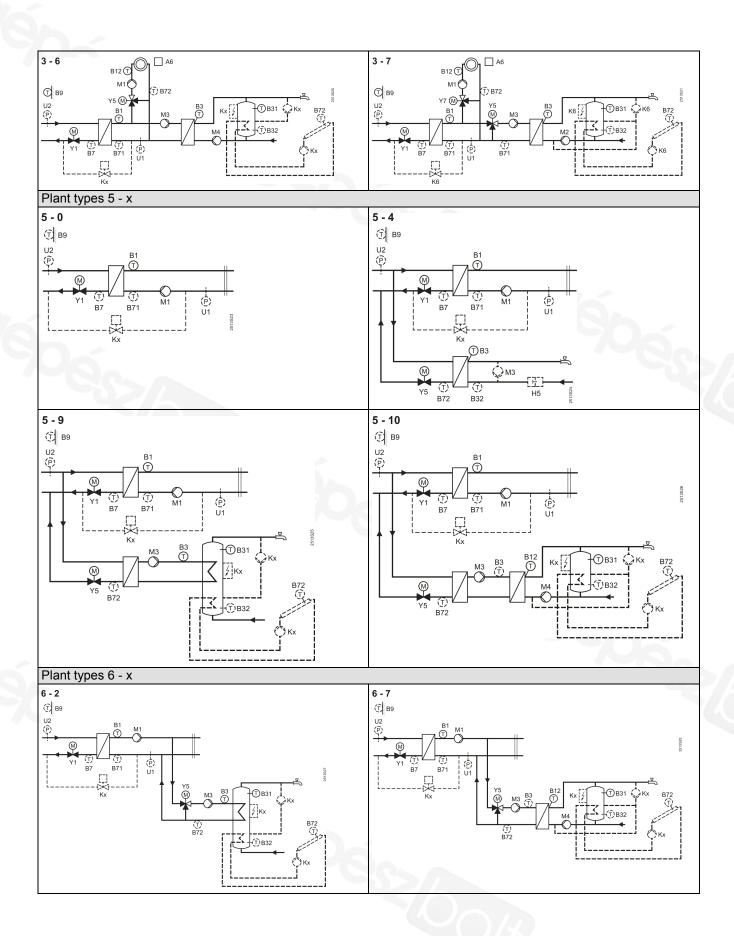

Optional functions are to be configured in addition to the standard functions.

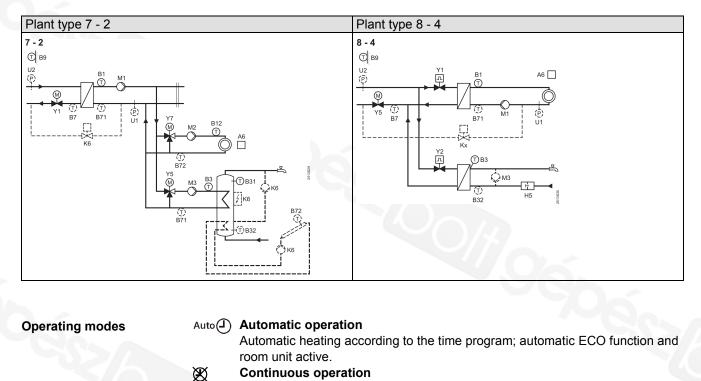

Plant types

Siemens Building Technologies CE1N2513en 2016-01-30

- Heating without time program, setpoint according to the setting knob.
- Protection
- Heating off, frost protection ensured.
- Automatic d.h.w. heating
- Manual control
 - No control, pumps in operation.

Notes

- Frost protection is ensured in all operating modes
- The operating mode of the heating circuit has no impact on d.h.w. heating

The RVD250 controller provides control of the following types of heating circuits:

Heating circuit control

- Pump heating circuit off heat exchanger
- Mixing heating circuit off heat exchanger
- Common flow off heat exchanger
- · Common flow off heat exchanger and separate mixing heating circuit

attenuated outside temperature. The building time constant is adjustable.

Compensating variables

Setpoints

Generation of the flow temperature setpoint

The assigned flow temperature setpoint is generated as follows:

temperature, and the room temperature for frost protection.

• For weather-compensated control: The setpoint is continuously determined by the outside temperature. The assignment of the flow temperature to the outside temperature is made by the heating curve

Adjustable are the setpoints for the nominal room temperature, the reduced room

With weather-compensated control, the composite outside temperature is used as the compensating variable. It is calculated (by the controller) from the current and the

- For weather-compensated control with room influence: The setoint is determined by the outside temperature and, in addition, by the deviation of room temperature setpoint and actual value
- For room-compensated control: The setpoint is determined by the room temperature deviation of setpoint and actual value

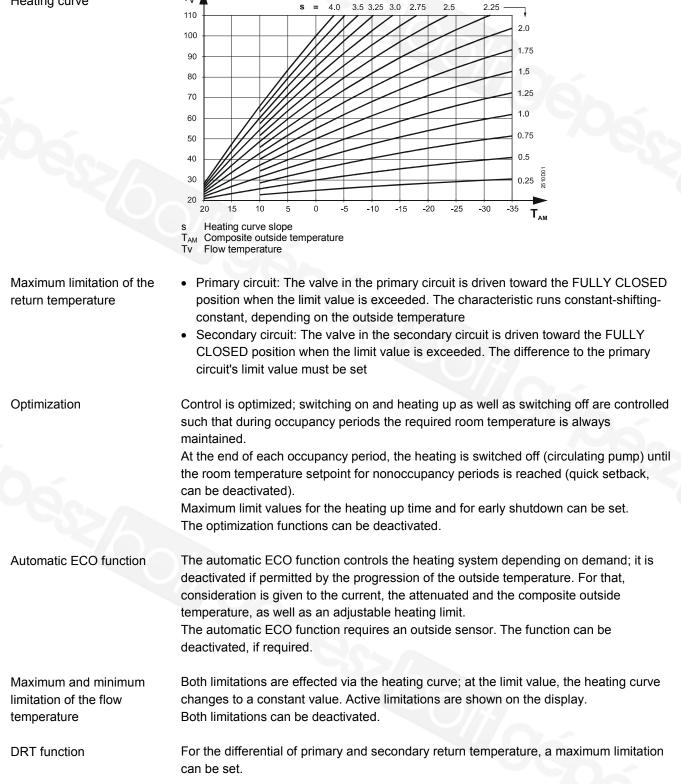

A maximum limitation can be set for limiting the rate the flow temperature setpoint increases. Also, a flow alarm is used; the period of time the flow temperature is allowed to remain outside a defined setpoint range can be set. When this period of time has elapsed, an error message is delivered.

Heating circuit control

T_v

The control variable for the heating circuit is the secondary flow temperature. With all plant types, control is provided via the 2-port valve in the primary return, depending on the plant's total demand for heat (heating circuit and d.h.w. circuit).

Heating curve

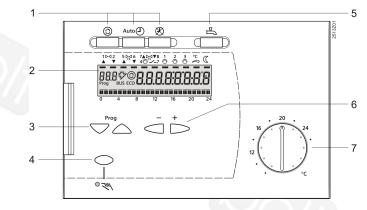

Pump and valve kick	A kick can be activated for all pumps and valves, aimed at preventing them from seizing. The kick lasts 30 seconds and is made once a week.
Relay and sensor test	 To facilitate commissioning and fault tracing, the controller can perform the tests: Relay test: Each relay can be manually energized Sensor test: The current sensor values can be queried Setpoint test: The current setpoints can be queried
Increasing the reduced room temperature	The setpoint of the reduced room temperature can be increased as the outside temperature drops. The rate of increase is adjustable. This function can be deactivated.
Frost protection for the building	Frost protection for the building ensures that an adjustable minimum room temperature is maintained. This function cannot be deactivated.
Frost protection for the plant	 Frost protection for the plant protects the heating system against freeze-ups by activating the heating circuit pump. It can be provided with or without outside sensor: With outside sensor: Outside temp. ≤ 1.5 °C: Heating circuit pump runs for 10 minutes at 6-hour intervals Outside temp. ≤ -5 °C: Heating circuit pump runs continuously Without outside sensor: Flow temp. ≤ 10 °C: Heating circuit pump runs for 10 minutes at 6-hour intervals Flow temp. ≤ 5 °C: Heating circuit pump runs continuously.
Signal inputs	 Analog input for displaying and forwarding DC 010 V signals, or for heat demand DC 010 V Digital input for pulses or signals from a flow switch or heat meter, for heat demand or alarms
Suppression of hydraulic creep	Minimum limitation of the flow rate aimed at suppressing hydraulic creep can act on both the heating circuit and the common primary return. The limitation is ensured by an auxiliary switch in the actuator.
Refill function	The RVD250 controller supports the refill function, aimed at maintaining the plant pressure on the secondary side. If the pressure drops below a minimum value, water is fed from the primary side or a separate tank to the plant's circuit on the secondary side to ensure the pressure will increase again.
Heating period	Outside the adjustable heating period, the heating circuit is switched off. The display shows ECO. Switching off takes place in addition to the automatic ECO function and summer- / wintertime changeover. Frost protection for the building and the plant is maintained. This function has no impact on d.h.w. heating.
Precontrol	Precontrol is accomplished via the valve in the heat exchanger's primary return, depending on demand. The heat demand signal is delivered via the LPB data bus.

D.h.w. heating	 The RVD250 controller provides d.h.w. control with the following plant types and d.h.w. heating systems: Stratification storage tank with charging pump (or diverting valve) and 2 sensors, with or without mixing valve in the d.h.w circuit (or intermediate circuit) Coil type storage tank with intermediate circuit pump and 2 sensors, with or without mixing valve in the d.h.w. circuit Directly off system's own heat exchanger The heat for the d.h.w. circuit can be supplied either by the system's own heat exchanger or the common flow (heating circuits and d.h.w. circuit).
Settings	The nominal and the reduced setpoint, maximum setpoint, setpoint increase, switching differential, overrun time of charging pump, and the maximum duration of d.h.w. charging are adjustable.
Frost protection for d.h.w.	A minimum d.h.w. temperature of 5 °C is always ensured.
Manual charging	 Independent of time program and temperature conditions During protection of heating circuit
Limitation	The maximum limitation of the primary return temperature can be adjusted. The adjusted limit value is independent of heating circuit control.
Releases	 The release of d.h.w. charging and the circulating pump can be selected: Always (24 hours a day) According to own d.h.w. time program During the controller's heating circuit time program (d.h.w. charging with forward shift of first daily release)
Priority	 The behavior of the heating circuit during d.h.w. charging can be selected: Absolute: Heating circuit pump OFF, or heating circuit mixing valve FULLY CLOSED and pump ON Shifting: Heating circuit pump remains ON as long as heat is available. Control to the d.h.w. temperature setpoint or the maximum setpoint Parallel: No priority; heating circuit remains ON. Control to the d.h.w. temperature setpoint or the maximum setpoint
Cooling down protection	In the case of instantaneous systems, the heat exchanger's primary side is heated up at certain intervals.
Flow switch	To improve the heat exchanger's control performance, with adjustable load limit and for seasonal adaptation and as child-proofing (flow switch prevents control from responding too frequently).
Forced charging	D.h.w. charging takes place daily, always at the time of the first release (or at midnight with the 24-hour program). It is performed also when the actual value lies within the switching differential.
Legionella function	The d.h.w. is heated up at certain intervals to ensure protection against legionella viruses.
Electric immersion heater and solar collector	In the case of plant types with d.h.w. storage tank, the 2 multifunctional relays for d.h.w. heating with electric immersion heater and solar collector can be parameterized.
Note	Availability of the above mentioned functions depends on the type of d.h.w. heating.

Miscellaneous functions

Time switch programs	 For automatic operation, the RVD250 controller has a 7-day program with 3 adjustable heating periods per day. Another 7-day program is available for the release of d.h.w. charging. Using the 365-day clock with automatic summer- / wintertime changeover, a maximum of 8 holiday periods can be programmed. During holiday periods: Heating circuit control is in protection mode and the d.h.w. will not be heated
Remote control with room unit	 Room unit QAW50: Changeover of operating mode, setting the room temperature setpoint, and room temperature readjustment Room unit QAW70: Overriding setpoints, the heating program and the holiday program
PWM output	A PWM (pulse width modulation) output is available for the connection of a speed- controlled pump.
Pulse lock for actuators	To reduce wear and tear on the relay contacts, the total duration of the OPEN / CLOSE pulses delivered to an actuator is limited to 5 times its running time.
Communication	 Via LPB, e.g. assignment of d.h.w., master-slave assignments for the time switch, reception of outside temperature signal, reception of heat demand (when RVD250 is used as a primary controller) Via M-bus
Manual control	 In the case of manual control, the heating can be controlled manually; d.h.w. heating remains activated. The relays are energized / deenergized as follows: Actuator driving the primary return valve: Dead, but can be controlled manually from the controller Other actuators fully closed, dead Heating circuit pump activated Collector pump activated and electric immersion heater released
Mechanical design	
Controller	The RVD250 consists of controller insert and base. The controller insert accommodates the electronics, the power section and 10 relays. The front carries the operating elements and the backlit display. The controller insert is secured to the base with 2 screws. The base accommodates the connection terminals.

Display and operating elements

1

- 2 3 4 5 6 7

- Buttons for selecting the operating mode Display (LCD) Buttons for selecting the operating lines Button for manual control ON / OFF Button for d.h.w. heating ON / OFF Buttons for adjusting values Setting knob for nominal room temperature setpoint

Operation	 Operating elements: Setting knob for the nominal room temperature setpoint Button for the respective operating mode Button for manual control Button for d.h.w. heating The setting and readjustment of all other parameters, the activation of functions and reading actual values and statuses follow the operating line principle. An operating line with a number is assigned to each parameter, each actual value and each function. For selection of the operating lines and the adjustment of values, 2 pairs of buttons (3) and (6) are available. The enclosed Operating Instructions can be inserted in the rear of the cover.
Notes	
Engineering Electrical installation	 The cables of the measuring circuits carry extra low-voltage The cables to the actuator and pumps carry AC 24230 V Local regulations for electrical installations must be complied with Sensor cables must not be run parallel to mains carrying cables powering actuators, pumps, etc. (safety class II conforming to EN 60730)
Radiator valves	In control systems using a room temperature sensor, the reference room must not be equipped with thermostatic radiator valves; manual valves must be locked in their fully open position.
Refill function	When making use of the refill function, the local regulations and those of the district heat utility must be observed.
Lightning protection	 If bus cables are also laid outside buildings, the devices are exposed to transients of lightning strokes and must be appropriately protected Every bus cable and the devices to be protected demand matching protective equipment Protection is ensured only if the installation is in proper working order For notes on installation in compliance with EMC requirements, refer to Data Sheet CE1N2034
Installation	
Types of mounting	 Wall mounting (on a wall, in a control panel, etc.) Standard mounting rail (top hat rail) Flush mounting (cutout in control panel door, etc.)
Mounting location	Suitable mounting locations are control panels, control desks, compact stations, or the heating room. Not permitted are damp or wet spaces.
Connections	All connection terminals for protective extra low-voltage (sensors and room unit bus) are located on the upper terminal block, those for mains voltage (actuators and pumps) on the lower terminal block.
Commissioning	 Selection of plant type The settings can be completely or partly disabled on the software side. In addition, the district heat parameters can be disabled on the hardware side The controller is supplied complete with Installation, Mounting and Commissioning Instructions

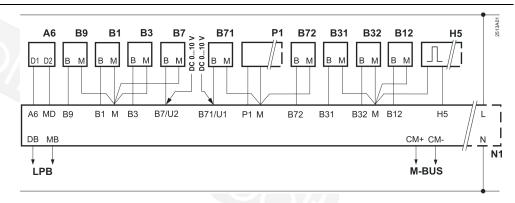

Disposal

	 The devices are considered electronics d Directive 2012/19/EU and may not be dis Dispose of the devices through channel Comply with all local and currently app 	posed of as domestic garbage. els provided for this purpose.

Connection diagrams

Low voltage side

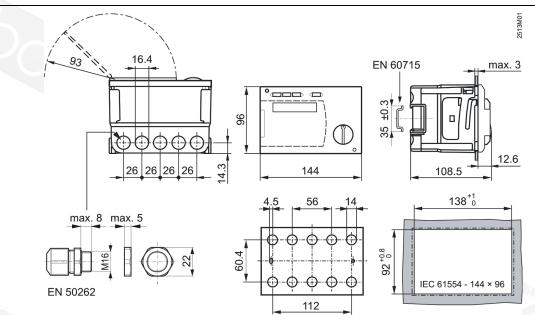

Mains voltage side

- A6 Room unit
- Flow sensor heating circuit / common flow* Flow sensor d.h.w. 2 / flow sensor heating circuit
- B1 B12
- B3 B31
- B32
- Β7
- B71 Secondary return sensor
- Primary / secondary return sensor / collector sensor B72
- B9 Outside sensor
- Heat meter, flow switch, alarm contact, etc. H5
- K6, K7 = multifunctional outputs for refill function / electric immersion heater / collector pump / Кχ circulating pump / flow alarm* Controller RVD250
- N1
- P1 Speed-controlled pump (PWM output)
- M1 Heating circuit / system pump
- M2 Heating circuit / storage tank charging / circulating pump*
- M3 D.h.w. intermediate circuit / storage tank charging / circulating pump / diverting valve (Y3)*
- M4 Storage tank charging pump
- U1 Secondary pressure sensor / external heat request
- U2 Primary pressure sensor
- Y1 Actuator of 2-port valve in the primary return
- Y5 Actuator'
- Actuator* Y7 According to plant type
- For suppression of hydraulic creep
